

Most commonly used Unix commands

(Always try your best to **read error message**.)

0. **who / whoami --- show who is logged on / print userid**
 - `$ who / $ whoami`
1. **date --- display date (& time)**
2. **pwd --- find out what directory you are in (**p**rint **w**orking **d**irectory)**
3. **ls --- see what files you have**
 - `$ ls -a / $ ls -l / $ ls -la`
4. **cp --- copy files**
 - `$ cp (file path1)/file_name1 (file path2)/file_name2`
 - **file_path ← 相對 / 絕對路徑**
5. **cat --- read file & output (to standard output) (good for short files) (concatenate)**
 - `$ cat file_name`
6. **more --- read files & output (line by line or page by page)**
 - `$ more file_name`
7. **head / tail --- display first / last part of file**
 - `$ head file_name / $ tail file_name`
8. **mkdir --- create directory (**m**ake **d**irectory)**
 - `$ mkdir directory_name`
9. **cd --- **c**hange **d**irectory**
 - `$ cd directory_name` (directory under current path)
 - `$ cd /etc/some_directory`
 - `$ cd ..` (up one level)
 - `$ cd` (back to home directory : your case, it's /home2/s106xxxx)

10. mv --- move and renaming files

- `$ mv (file path1)/file_name1 (file path2)/file_name2`

11. rm --- remove a file (or directory)

- `$ rm (file path1)/file_name`
- `$ rm -r directory`
- `$ rm -rf directory`

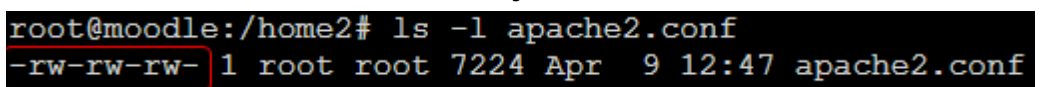

12. rmdir --- remove directory

- `$ rmdir directory` (directory need to be empty)

13. touch --- change file timestamps (or create one if not exist)

14. chmod --- change permissions (mode)

- `$ chmod 777 file_name / directory_name`

◆ 
root@moodle:/home2# ls -l apache2.conf
-rw-rw-rw- 1 root root 7224 Apr 9 12:47 apache2.conf

15. chown / chgrp --- change file owner and group

- `$ chown tkwu file_name / directory_name`

16. Pipe (|) & redirection (< or > / << or >>)

- `$ cat file1 > file2`
- `$ cat file1 | more`

17. df --- report file system disk space usage

- `$ df -h`

18. top --- display Linux processes & etc

19. ps --- report a snapshot of the current processes

- `$ ps ax`

20. kill --- send a signal to a process

- `$ ps -a`
- `$ kill -9 a_process`

21. ftp --- connect to a remote machine to download or upload files

22. grep --- search for keyword in a file (g/RE/p = globally

search for RE and print it. (RE = Regular Expression 正規表示法/關鍵字)

23. find --- search for files in a directory hierarchy

24. tar --- create an archive, add or extract files

■ tar / ftp ← Later when we are on BACKUP

25. slogin --- OpenSSH SSH client (remote login program)

■ telnet --- log in to another machine

26. ln --- make links between files

27. fg / bg / ctrl Z --- foreground / background / make background
